

Description

SE9016 is a complete constant-current & constant voltage linear charger for single cell lithium-ion and Lithium-Polymer batteries. Its SOT-23 package and low external component count make SE9016 ideally suited for portable applications. Furthermore, the SE9016 is specifically designed to work within USB power specification. At the same time, SE9016 can also be used in the standalone lithium-ion and Lithium-polymer battery chargers.

No external sense resistor is needed, and no blocking diode is required due to the internal MOSFET architecture. Thermal feedback regulates the charge current to limit the die temperature during high power operation or high ambient temperature. The charge voltage is fixed at 4.22V, and the charge current can be programmed externally with a single resistor. The SE9016 automatically terminates the charge cycle when the charge current drops to 1/10th the programmed value after the final float voltage is reached.

When the input supply (wall adapter or USB supply) is removed, the SE9016 automatically enters a low current stage, dropping the battery drain current to less than 20uA. The SE9016 can be put into shutdown mode, reducing the supply current to 20uA.

Other features include charge current monitor, undervoltage lockout, automatic recharge and a status pin to indicate charge termination and the presence of an input voltage. SE9016 is intentionally designed to have slightly negative Tempco. This provides extra protection to Lithium

Features

- Programmable Charge Current Up to 800mA.
- No MOSFET, Sense Resistor or Blocking Diode Required.
- Constant-Current/Constant-Voltage Operation with Thermal Protection to Maximize Charge Rate without Risk of Overheating.
- Charges Single Cell Li-Ion Batteries Directly from USB Port.
- Preset 4.22V Charge Voltage with $\pm 1\%$ Accuracy.
- 20uA Supply Current in Shutdown.
- 2.9V Trickle Charge Threshold
- Soft-Start Limits Inrush Current.
- Available in 5-Lead SOT-23 Package.
- 100% Lead (Pb)-Free

Application

- Cellular Telephones, PDA's, MP3 Players.
- Charging Docks and Cradles
- Bluetooth Applications

Application Diagram

Pin Configuration

Absolute Maximum Rating ⁽¹⁾

Parameter	Symbol	Value	Units
Input Supply Voltage	V_{CC}	7	V
PROG Voltage	V_{PROG}	$V_{CC}+0.3$	V
BAT Voltage	V_{BAT}	7	V
CHRG Voltage	V_{CHRG}	7	V
BAT Short-Circuit Duration		Continuous	
Thermal Resistance, Junction-to-Ambient	Θ_{JA}	250	°C/W
BAT Pin Current	I_{BAT}	800	mA
PROG Pin Current	I_{PROG}	800	μA
Maximum Junction Temperature	T_J	125	°C
Storage Temperature	T_S	-65 to +125	°C
Lead Temperature (Soldering, 10 sec)		300	°C

Operating Rating ⁽²⁾

Parameter	Symbol	Value	Units
Supply Input Voltage	V_{IN}	-0.3 to +7	V
Junction Temperature	T_J	-40 to +85	°C

Electrical Characteristics

$V_{IN} = 5V$; $T_J = 25^\circ C$; unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{CC}	Input Supply Voltage		3.5		6	V
I_{CC}	Input Supply Current	Charge Mode ⁽³⁾ , $R_{PROG} = 10k$		110	500	μA

		Shutdown Mode (R_{PROG} Not Connected)		+/-0.5	+/-5	μA
		Sleep Mode, $V_{CC} = 0V$		+/-1	+/-5	μA
I_{TRIKL}	Trickle Charge Current	$V_{BAT} < V_{TRIKL}$, $R_{PROG} = 10k$		10		mA
V_{TRIKL}	Trickle Charge Threshold Voltage	$R_{PROG} = 10k$, V_{BAT} Rising	2.8	2.9	3.0	V

Electrical Characteristics (Continued)

$V_{IN} = 5V$; $T_J = 25^{\circ}C$; unless otherwise specified

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{UV}	V_{CC} Undervoltage Lockout Threshold	From V_{CC} Low to High		3.4		V
V_{UVHYS}	V_{CC} Undervoltage Lockout Hysteresis			100		mV
V_{MSD}	Manual Shutdown Threshold Voltage	PROG Pin Rising		1.25		V
		PROG Pin Falling		1.2		V
V_{ASD}	$V_{CC} - V_{BAT}$ Lockout Threshold Voltage	V_{CC} from Low to High		100		mV
		V_{CC} from High to Low		30		mV
I_{TERM}	C/10 Termination Current Threshold	$R_{PROG} = 10k^{(4)}$		0.1		mA/mA
		$R_{PROG} = 2k$		0.1		mA/mA
V_{PROG}	PROG Pin Voltage	$R_{PROG} = 10k$, Current Mode	0.9	1.03	1.1	V
V_{CHRG}	CHRG Pin Output Low Voltage	$I_{CHRG} = 5mA$		0.6		V
ΔV_{RECHRG}	Recharge Battery Threshold Voltage	$V_{FLOAT} - V_{RECHRG}$		100		mV
T_{LIM}	Thermal Protection Temperature			120		$^{\circ}C$
t_{SS}	Soft-Start Time	$I_{BAT} = 0$ to $1000V/R_{PROG}$		100		μs
$t_{RECHARGE}$	Recharge Comparator Filter Time	V_{BAT} High to Low		1		ms
t_{TERM}	Termination Comparator Filter Time	I_{BAT} Falling Below $I_{CHG}/10$		1000		μs
I_{PROG}	PROG Pin Pull-Up Current			1		μA

Note 1: Exceeding the absolute maximum rating may damage the device.

Note 2: The device is not guaranteed to function outside its operating rating.

Note 3: Supply current includes PROG pin current (approximately 100 μA) but does not include any current delivered to the battery through the BAT pin (approximately 100mA).

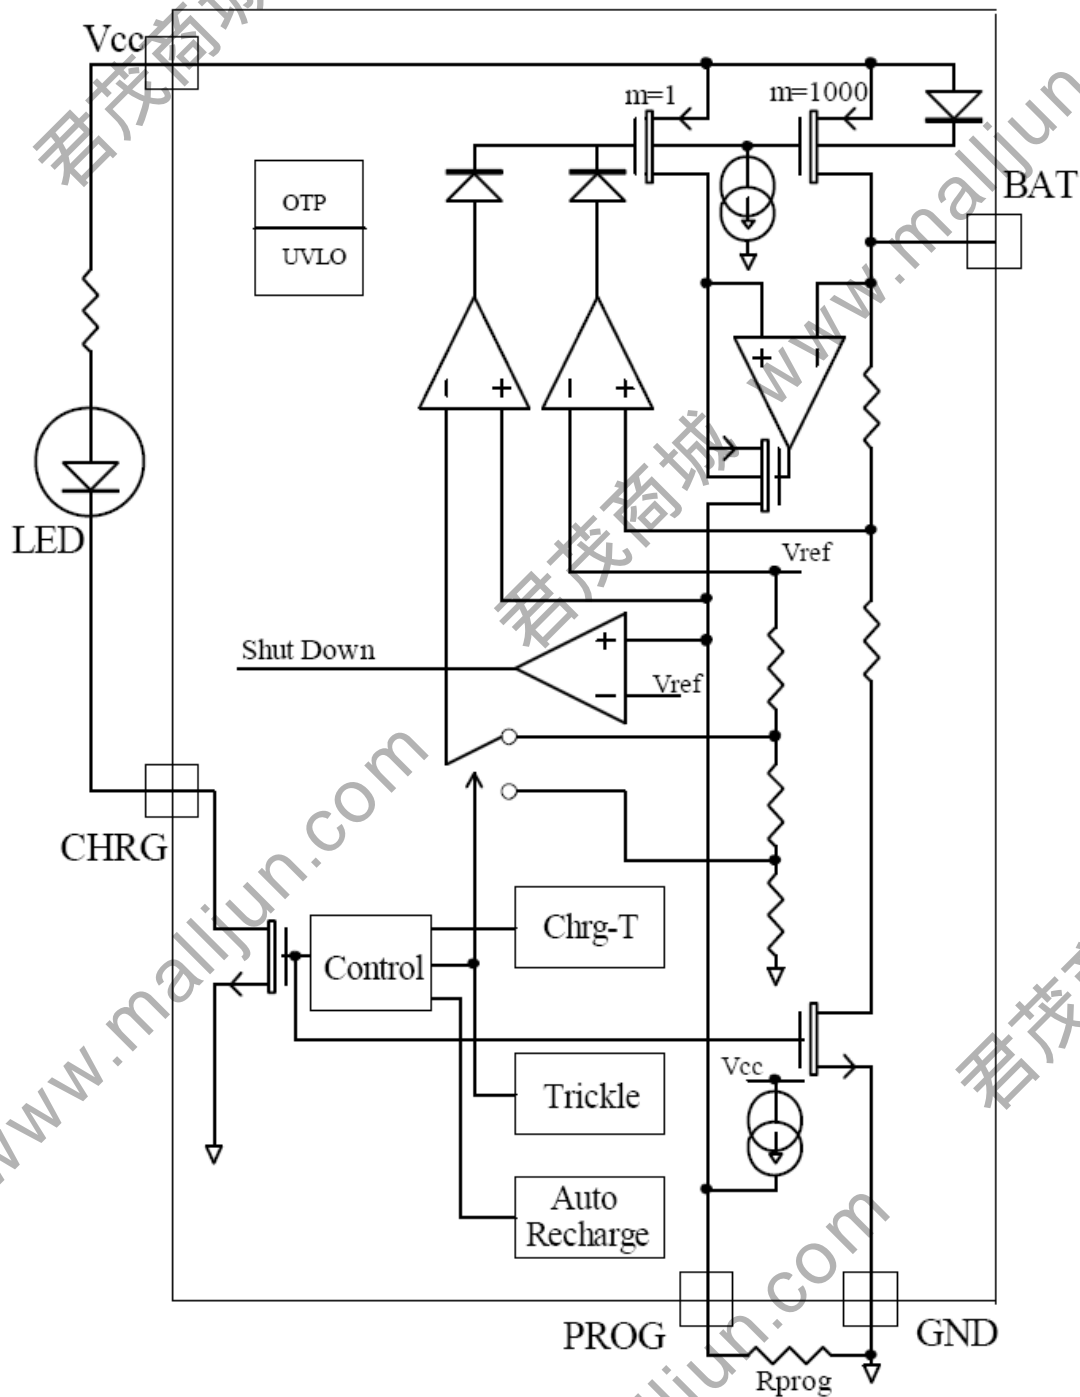

Note 4: I_{TERM} is expressed as a fraction of measured full charge current with indicated PROG resistor.

Pin Functions

Pin	Pin Function Description	Pin	Pin Function Description
VCC	Positive Input Supply Voltage. Provides power to the charger. VCC can range from 3.5 to 6.5V and should be bypassed with at least a 1 μF capacitor.	CHRG	Open-Drain Charge Status Output. When the battery is charging, the CHRG pin is pulled low by an internal N-channel MOSFET. When the charge cycle is completed, a weak pull-down of approximately 20 μA is connected to the CHRG pin, indicating an "AC present" condition.
GND	Ground.	PROG	Charge Current Program, Charge Current Monitor and Shutdown Pin.
BAT	Charge Current Output. Provides charge current to the battery and regulates the final float voltage to 4.22V.

Operation

The SE9016 is a single cell lithium-ion battery charger using a constant-current/constant-voltage algorithm. It can deliver up to 800mA of charge current (using a good thermal PCB layout) with a final float voltage accuracy of $\pm 2\%$. The SE9016 includes an internal P-channel power MOSFET and thermal regulation circuitry. No blocking diode or external current sense resistor is required; thus, the basic charger circuit requires only two external components. Furthermore, the SE9016 is capable of operating from a USB power source.

Normal Charge Cycle

A charge cycle begins when the voltage at the VCC pin rises above the UVLO threshold level and a 1% program resistor is connected from the PROG pin to ground or when a battery is connected to the charger output. If the BAT pin is less than 2.8V, the charger enters trickle charge mode. In this mode, the SE9016 supplies approximately 1/10 the programmed charge current to bring the battery voltage up to a safe level for full current charging. When the BAT pin voltage rises above 2.8V, the charger enters constant-current mode, where the programmed charge current is supplied to the battery. When the BAT pin approaches the final float voltage (4.22V), the SE9016 enters constant-voltage mode and the charge current begins to decrease. When the charge current drops to 1/10 of the programmed value, the charge cycle ends.

Programming Charge Current

The charge current is programmed using a single resistor from the PROG pin to ground. The battery charge current is 1100 times the current out of the PROG pin. The program resistor and the charge

current are calculated using the following equations:

$$R_{PROG} = \frac{1100V}{I_{CHG}}, I_{CHG} = \frac{1100V}{R_{PROG}},$$

The charge current out of the BAT pin can be determined at any time by monitoring the PROG pin voltage using the following equation:

$$I_{BAT} = \frac{V_{PROG}}{R_{PROG}} \bullet 1100$$

This actual current will vary from IC to IC. The typical variation is within $\pm 20\%$.

Charge Termination

A charge cycle is terminated when the charge current falls to 1/10th the programmed value after the final float voltage is reached. This condition is detected by using an internal, filtered comparator to monitor the PROG pin. When the PROG pin voltage falls below 100mV for longer than t_{TERM} (typically 1ms), charging is terminated. The charge current is latched off and the SE9016 enters standby mode, where the input supply current drops to 200mA. (Note: C/10 termination is disabled in trickle charging and thermal limiting modes).

When charging, transient loads on the BAT pin can cause the PROG pin to fall below 100mV for short periods of time before the DC charge current has dropped to 1/10th the programmed value. The 1ms filter time (t_{TERM}) on the termination comparator ensures that transient loads of this nature do not result in premature charge cycle termination. Once the average charge current drops below 1/10th the programmed value, the SE9016 terminates the charge cycle and ceases to provide any current through the BAT pin. In this state, all loads on the BAT pin must be supplied by the battery.

The SE9016 constantly monitors the BAT pin voltage

Charge Status Indicator (CHRG)

Thermal Limiting

Undervoltage Lockout (UVLO)

An internal undervoltage lockout circuit monitors the input voltage and keeps the charger in shutdown mode until VCC rises above the undervoltage lockout threshold. The UVLO circuit has a built-in hysteresis of 200mV. Furthermore, to protect against reverse current in the power MOSFET, the UVLO circuit keeps the charger in shutdown mode if VCC falls to within 30mV of the battery voltage. If the UVLO comparator is tripped, the charger will not come out of shutdown mode until VCC rises 100mV above the battery voltage.

Application Hints

Stability Considerations

The constant-voltage mode feedback loop is stable without an output capacitor provided a battery is connected to the charger output. With no battery present, an output capacitor is recommended to reduce ripple voltage. When using high value, low ESR ceramic capacitors, it is recommended to add a 1Ω resistor in series with the capacitor. No series resistor is needed if tantalum capacitors are used.

In constant-current mode, the PROG pin is in the feedback loop, not the battery. The constant-current mode stability is affected by the impedance at the PROG pin. With no additional capacitance on the PROG pin, the charger is stable with program resistor values as high as 20k. However, additional capacitance on this node reduces the maximum allowed program resistor. The pole frequency at the PROG pin should be kept above 100kHz.

V_{CC} Bypass Capacitor

Many types of capacitors can be used for input bypassing, however, caution must be exercised when using multilayer ceramic capacitors. Because of the self-resonant and high Q characteristics of some types of ceramic capacitors, high voltage transients can be generated under some start-up conditions, such as connecting the charger input to a live power source. Adding a 1.5Ω resistor in series with a ceramic capacitor will minimize start-up voltage transients.

Power Dissipation

The conditions that cause the SE9016 to reduce charge current through thermal feedback can be approximated by considering the power dissipated in the IC. Nearly all of this power dissipation is generated by the internal MOSFET—this is calculated to be approximately:

$$P_D = (V_{CC} - V_{BAT}) \cdot I_{BAT}$$

The approximate ambient temperature at which the thermal feedback begins to protect the IC is:

$$T_A = 120^\circ\text{C} - P_D \theta_{JA}$$

$$T_A = 120^\circ\text{C} - (V_{CC} - V_{BAT}) \cdot I_{BAT} \cdot \theta_{JA}$$

Thermal Considerations

Because of the small size of the thin SOT23 package, it is very important to use a good thermal PC board layout to maximize the available charge current. The thermal path for the heat generated by the IC is from the die to the copper lead frame, through the package leads, (especially the ground lead) to the PC board copper. The PC board copper is the heat sink. The footprint copper pads should be as wide as possible and expand out to larger copper areas to spread and dissipate the heat to the surrounding ambient. Other heat sources on the board, not related to the charger, must also be considered when designing a PC board layout because they will affect overall temperature rise and the maximum charge current.
